- MS Word
- Trello
- Notion
- Asana

Work Experience

Full Stack Web Developer | Chickadee Investment

Jan. 2023 - Present

Three developers joined the project to create a website for Landlord-Tenant communication. We configured the backend using C# and the frontend using React. Roles for owners, tenants, and superadmins were created and assigned accordingly on the website. We held team meetings every week and client meetings every other week to gather feedback.

Internship | Industrial Bank Of Korea

Jan. 2015 -Feb.2015

Associate staff explained cards and products to customers. I improved the staff's user experience by classifying and labeling files in the bank warehouse. I learned effective communication techniques. Our team leader and I successfully acquired over 50 new accounts through promoting IBK corporate bank apps.

Projects

SafeHouse | Next Js Tailwind Firebase Storybook CSS

Sep. 2022 - Dec. 2022

The Safe House app is designed to provide support for those affected by wildfires in British Columbia. The app was developed by a team of 3 developers and 4 design teams. We implemented an agile system using Asana, which allowed us to assign tasks to team members on a weekly basis. My role involved enabling users to view the location and information of safe houses through Google Maps when the host updates the information, and managing data transfer through Firebase to fetch information.

Food social media application | EJS Express JS MySQL CSS

Apr. 2022 - May. 2022

I worked with design course students to create a food-related social media application. We used Kanban, Trello, Miro, and GitHub to organize our work in weekly sprints. I built the foundation of the application using Express.js, created a container for users to upload images, stored data in a MySQL database, retrieved data using queries, and obtained restaurant information using the Google Maps and Yelp API. I also created a display on the map and a personal information page that allows users to view posts created by individual users and their follower information.

Coughie | Preact CSS

Sep. 2022 - Dec. 2022

Coughie is a mobile-first web application designed to help people who want to quit their vaping habit. Users can input, track their progress, join a community, while growing their virtual plant 🌱 Here, I created a form for a one-page survey that appears when the user logs in for the first time. Once the user fills it out, their information is saved to local storage. This information is then used to create a personal information box, track the user's status, or allow them to quit the survey.

It is a personal project made during summer vacation, using various functions of React. This is a web app that allows people to track their daily emotions and reflect on how they're feeling.

Education Qualification

Full Stack Web Development	BCIT	2021 - 2023
Economic, Accounting	Catholic University Of Korea	2008 - 2015
